

Name: \_\_\_\_\_

ID number: \_\_\_\_\_

- Duration: 50 MINUTES. 50 Marks
- There are FIVE questions, on FIVE pages. Attempt every question in the spaces provided. Use the reverse side if you run out of space.
- Write your name and ID number in the spaces provided.

**Question 1.**

(9 marks)

- (a) State the Handshaking Lemma. [2]

- (b) Let  $G$  be a connected graph. Give the definition of a *spanning tree* of  $G$ . [1]

- (c) Let  $G$  be a graph. Prove that  $G$  is a forest if and only if every edge of  $G$  is a bridge. [6]

**Question 2.**

(12 marks)

(a) Let  $G$  be a graph. Give the definition of a *vertex cut* of  $G$ . [1]

(b) Let  $G$  be a simple graph. Give the definition of a *block* of  $G$ . [2]

(c) Let  $G$  be a graph. Are the following statements true or false? Justify your answer with an explanation if true, or give a counterexample if false.

(i) If  $H$  is a subgraph of  $G$ , then  $H$  is an induced subgraph of  $G$ . [3]

(ii) If  $H$  is an induced subgraph of  $G$ , then  $H$  is a minor of  $G$ . [3]

(iii) If  $G$  is simple and 2-connected, then  $G$  has exactly one block. [3]

**Question 3.**

(8 marks)

(a) By drawing an appropriate graph, give a clearly illustrated example of the following:

- a graph with exactly one cut vertex and exactly one bridge. [2]

(b) Let  $G$  be a 3-connected graph with a vertex  $v$ . Prove that  $G - v$  is 2-connected. [6]

**Question 4.**

(14 marks)

(a) Are the following statements true or false? Justify your answer with an explanation if true, or give a counterexample if false.

(i) If  $G$  is a 3-connected graph with at least five vertices, and  $e$  is an edge of  $G$ , then  $G/e$  is 3-connected. [3]

(ii) For every integer  $k \geq 2$ , there exists a  $k$ -connected graph with precisely  $k + 1$  vertices. [3]

(b) Let  $G$  be a graph and let  $X$  and  $Y$  be subsets of  $V(G)$ . Menger's Theorem states that the maximum number of vertex-disjoint  $(X, Y)$ -paths is equal to the minimum order of a separation that separates  $X$  from  $Y$ .

(i) Define what is meant by an  $(X, Y)$ -path. [1]

(ii) Define what it means for a separation  $\{A, B\}$  to separate  $X$  from  $Y$ . [1]

(iii) Explain why it follows from Menger's theorem that if  $G$  is 2-connected and  $X$  and  $Y$  each have size two, then there are two vertex-disjoint  $(X, Y)$ -paths in  $G$ . [6]

**Question 5.**

(7 marks)

- (a) Define a *plane graph* (you may make reference to a *planar embedding* without defining this term). [1]

- (b) Define the *degree* of a face in a plane graph. [1]

- (c) By drawing an appropriate graph, give clearly illustrated examples of the following:

- (i) A connected plane graph with a face whose boundary is not a cycle. [2]

- (ii) A plane graph  $G$  such that  $(G^*)^* \neq G$ . [3]

This page is deliberately left blank, for extra working.
